

Figure 1

Cross-disease re-analysis of the IDI2-AS1 / IL5 axis in IL5-driven allergic disease

Five public bulk RNA-seq cohorts, 856 samples, uniform pipeline

STAGE 1 — Datasets

STAGE 2 — Uniform pipeline

STAGE 3 — Three in vivo questions

STAGE 4 — Principal finding

Tissue-bulk IDI2-AS1 expression is invariant in every cohort (pooled $\log_2\text{FC} \approx 0$; $I^2 = 0.26\%$).
Sample-level IDI2-AS1 vs IL5 covariation is POSITIVE — opposite to the in vitro repressive direction.
Causal mediation in the asthma cohort attributes $\approx 90\%$ of the covariation to the eosinophil compartment
(ACME = $+0.109$, $p = 0.002$); within-tissue direct effect ~ 0 (ADE = $+0.012$, $p = 0.76$).
□ The published in vitro IDI2-AS1 → IL5 axis is MASKED, not contradicted, by bulk RNA-seq.
□ Single-cell follow-up is the natural next step.
